Title : Metallic closures in contact with foodsuffs – Determination of Polyadipates (PAD) having molecular weight lower than 1000 Da in vegetal oil (D2) food simulant
Scope : This standard is related to a methodology that make use of liquid chromatography mass spectrometry (LC-MS) in order to determinate the specific migration of polyadipates (PAD) with molecular weight lower than 1000 Da in vegetal oil D2 food simulant from metallic closures. The LC-MS method is suitable for the quantitative determination of PAD from the LoQ to 300 mg/kg food simulant, according to the explained test conditions. For the determination, PAD analytical standards from the producers or from the users are required. In order to cover the potential difficulties in finding the standards and the information concerning their molecular weights (essential data for the determination of the results), three other approaches are proposed as alternatives. The first one is based on the co-definition between the involved parts of a percentage relate to molecular weights distribution <1000 Da; the second one suggest the determination of this value according to UNI CEN/TS 14577; the third is based onto gaschromatography mass spectrometry (GC-MS; however, for this method, no validation and precision data are available).
